Footnotes:

1 Farm surveys collect data from Quebec, Ontario, Manitoba, Saskatchewan and Alberta at all six survey occasions during the crop year (which extends from the December to the following November occasion). However, data are collected twice a year (in the June Farm survey on seeded areas and in the November Farm survey on final crop production) for Newfoundland and Labrador, Prince Edward Island, Nova Scotia, New Brunswick and British Columbia, which represent between 2% and 4% of national totals. As of July 2014 for the Atlantic provinces and British Columbia, July and September production estimates are calculated using the final estimates of the last three crop years. The harvested area is first estimated based on the ratio obtained from the sum of harvested areas of the last three years over the sum of the seeded areas of the last three years. This average ratio is applied to their current year's reported seeded acreage from the June survey. This estimated harvested area is then multiplied by the average yield of the last three years to estimate production.

2 For imperial data see CANSIM table 001-0017.

31 Totals may not equal the sum of their parts due to the use of conversion factors or rounding of fractions to whole numbers.
