Mental Math in the Elementary Mathematics Curriculum

Mental math in this guide refers to fact learning, mental computation, and computational estimation. The Atlantic Canada Mathematics Curriculum supports the acquisition of these skills through the development of thinking strategies across grade levels.

Pre-Operational Skills
Many children begin school with a limited understanding of number and number relationships. Counting skills, which are essential for ordering and comparing numbers, are an important component in the development of number sense. Counting on, counting back, concepts of more and less, and the ability to recognize patterned sets, all mark advances in children’s development of number ideas.

Basic facts are mathematical operations for which some students may not be conceptually prepared. As a minimum, the following skills should be in place before children are expected to acquire basic facts.

- Students can immediately name the number that comes after a given number from 0-9, or before a given number from 2-10.
- When shown a familiar arrangement of dots ≤ 10 on ten frames, dice, or dot cards, students can quickly identify the number without counting.
• For numbers ≤ 10 students can quickly name the number that is one-more, one-less; two-more, two-less. (the concept of less tends to be more problematic for children and is related to strategies for the subtraction facts)

Mental mathematics must be a consistent part of instruction in computation from primary through the elementary and middle grades.

| B7- use mental strategies to find sums to 18 and differences from 18 or less | P. 28
| B8- memorize simple addition and/or subtraction facts from among those for which the total is 10 or less | • Doubles Facts for addition and subtraction facts
| C5- use number patterns to help solve addition and subtraction sentences | P. 36
|                     | • Using patterns to learn the facts
|                     | • Commutative property (3+2 = 2+3) |
| **Grade 2**         |                     |
| B5- develop and apply strategies to learn addition and subtraction facts | P. 22
| B11- estimate the sum or difference of two 2-digit numbers | • Doubles plus 1
|                     | • Make 10 (“bridging to 10”) |
| Fact learning is a mental exercise with an oral and/or visual prompt; the focus is oral, rather than paper-and pencil; drills should be short with immediate feedback over an extended period of time. | • Two-apart facts; double in-between
|                     | • Subtraction as “think addition” |
| P. 30 (Estimation)  | • Compensation |
|                     | • Balancing for a constant difference |
|                     | • Rounding both numbers to the nearest 10 |
|                     | • Round one number up and one number down |
|                     | • Front-end estimation |
| **Grade 3**         |                     |
| B11/12- mentally add and subtract two-digit and one-digit numbers, and rounded numbers. | P. 34
| B9- continue to estimate in addition and subtraction situations | • Make 10 |
| B10- begin to estimate in multiplication and division situations | • Compatible numbers (“partner” numbers)
| C3 - use and recognize the patterns in a multiplication table | • Front-end addition
|                     | • Back up through ten (“counting on”) |
|                     | • Compensation |
|                     | • Balancing for a constant difference |
| P. 28               | • Commutative property for multiplication (3x2 = 2x3)
<p>|                     | • Division as “think multiplication” |
|                     | • Helping facts |</p>

**Students should perform mental computations with facility using strategies outlined in the Mental Math Guides.**
Definitions and Connections

**Fact learning** refers to the acquisition of the 100 number facts relating to the single digits 0-9 in each of the four operations. Mastery is defined by a correct response in 3 seconds or less.

**Mental computation** refers to using strategies to get exact answers by doing most of the calculations in one’s head. Depending on the number of steps involved, the process may be assisted by quick jottings of sub-steps to support short term memory.

**Computational estimation** refers to using strategies to get approximate answers by doing calculations mentally.

Students develop and use thinking strategies to recall answers to basic facts. These are the foundation for the development of other mental calculation strategies. When facts are automatic, students are no longer using strategies to retrieve them from memory.

Basic facts and mental calculation strategies are the foundations for estimation. Attempts at estimation are often thwarted by the lack of knowledge of the related facts and mental math strategies.

**Computational Fluency**
Rationale

In modern society, the development of mental computation skills needs to be a goal of any mathematical program for two important reasons. First of all, in their day-to-day activities, most people's calculation needs can be met by having well developed mental computational processes. Secondly, while technology has replaced paper-and-pencil as the major tool for complex computations, people still need to have well developed mental strategies to be alert to the reasonableness of answers generated by technology.

In modern society, the development of mental computation skills needs to be a goal of any mathematics program.

Besides being the foundation of the development of number and operation sense, fact learning is critical to the overall development of mathematics. Mathematics is about patterns and relationships and many of these are numerical. Without a command of the basic facts, it is very difficult to detect these patterns and relationships. As well, nothing empowers students more with confidence, and a level of independence in mathematics, than a command of the number facts.

...nothing empowers students more with confidence, and a level of independence in mathematics, than a command of the number facts.

Teaching Mental Computation Strategies

The development of mental math skills in the classroom should go beyond drill and practice by providing exercises that are meaningful in a mathematical sense. All of the strategies presented in this guide emphasize learning based on an understanding of the underlying logic of mathematics.
While learning addition, subtraction, multiplication and division facts, for instance, students learn about the properties of these operations to facilitate mastery. They apply the commutative property of addition and multiplication, for example, when they discover that $3 + 7$ is the same as $7 + 3$ or that $3 \times 7 = 7 \times 3$. Knowing this greatly reduces the number of facts that need to be memorized. They use the distributive property when they learn that $12 \times 7$ is the same as $(10 + 2) \times 7 = (7 \times 10) + (2 \times 7)$ which is equal to $70 + 14 = 84$.

Understanding our base ten system of numeration is key to developing computational fluency. At all grades, beginning with single digit addition, the special place of the number 10 and its multiples is stressed. In addition, students are encouraged to add to make 10 first, and then add beyond the ten. Addition of ten and multiples of ten is emphasized, as well as multiplication by 10 and its multiples.

Connections between numbers and the relationship between number facts should be used to facilitate learning. The more connections that are established, and the greater the understanding, the easier it is to master facts. In multiplication, for instance, students learn that they can get to $6 \times 7$ if they know $5 \times 7$, because $6 \times 7$ is one more group of 7.

**Introducing Thinking Strategies to Students**

In general, a strategy should be introduced in isolation from other strategies. A variety of practice should then be provided until it is mastered, and then it should be combined with other previously learned strategies. Knowing the name of a strategy is not as important as knowing how it works. That being said, however, knowing the names of the strategies certainly aids in classroom communication. In the mental math guides for each grade, strategies are consistently named; however, in some other resources, you may find the same strategy called by a different name.
When introducing a new strategy, use the chalkboard, overhead or LCD projector, to provide students with an example of a computation for which the strategy works. Are there any students in the class who already have a strategy for doing the computation in their heads? If so, encourage them to explain the strategy to the class with your help. If not, you could share the strategy yourself.

Explaining the strategy should include anything that will help students see its pattern, logic, and simplicity. That might be concrete materials, diagrams, charts, or other visuals. The teacher should also “think aloud” to model the mental processes used to apply the strategy and discuss situations where it is most appropriate and efficient as well as those in which it would not be appropriate at all.

In the initial activities involving a strategy, you should expect to have students do the computation the way you modeled it. Later, however, you may find that some students employ their own variation of the strategy. If it is logical and efficient for them, so much the better. Your goal is to help students broaden their repertoire of thinking strategies and become more flexible thinkers; it is not to prescribe what they must use.

You may find that there are some students who have already mastered the simple addition, subtraction, multiplication and division facts with single-digit numbers. Once a student has mastered these facts, there is no need to learn new strategies for them. In other words, it is not necessary to re-teach a skill that has been learned in a different way.
On the other hand, most students can benefit from the more difficult problems even if they know how to use the written algorithm to solve them. The emphasis here is on mental computation and on understanding the place-value logic involved in the algorithms. In other cases, as in multiplication by 5 (multiply by 10 and divide by 2), the skills involved are useful for numbers of all sizes.

**Practice and Reinforcement**

In general, it is the frequency rather than the length of practice that fosters retention. Thus daily, brief practices of 5-10 minutes are most likely to lead to success.

In general, it is the frequency rather than the length of practice that fosters retention. Thus daily, brief practices of 5-10 minutes are most likely to lead to success. Once a strategy has been taught, it is important to reinforce it. The reinforcement or practice exercises should be varied in type, and focus as much on the discussion of how students obtained their answers as on the answers themselves.

The selection of appropriate exercises for the reinforcement of each strategy is critical. The numbers should be ones for which the strategy being practiced most aptly applies and, in addition to lists of number expressions, the practice items should often include applications in contexts such as money, measurements and data displays. Exercises should be presented with both visual and oral prompts and the oral prompts that you give should expose students to a variety of linguistic descriptions for the operations. For example, $5 + 4$ could be described as:

- the sum of 5 and 4
- 4 added to 5
- 5 add 4
- 5 plus 4
- 4 more than 5
- 5 and 4 etc.
Response Time

• Basic Facts
In the curriculum guide, fact mastery is described as a correct response in 3 seconds or less and is an indication that the student has committed the facts to memory. This 3-second-response goal is a guideline for teachers and does not need to be shared with students if it will cause undue anxiety. Initially, you would allow students more time than this as they learn to apply new strategies, and reduce the time as they become more proficient.

This 3-second-response goal is a guideline for teachers and does not need to be shared with students if it will cause undue anxiety.

• Mental Computation Strategies
With other mental computation strategies, you should allow 5 to 10 seconds, depending on the complexity of the mental activity required. Again, in the initial stages, you would allow more time, and gradually decrease the wait time until students attain a reasonable time frame. While doing calculations in one’s head is the principal focus of mental computation strategies, sometimes in order to keep track, students may need to record some sub-steps in the process. This is particularly true in computational estimation when the numbers may be rounded. Students may need to record the rounded numbers and then do the calculations mentally for these rounded numbers.

In many mental math activities it is reasonable for the teacher to present a mental math problem to students, ask for a show of hands, and then call on individual students for a response. In other situations, it may be more effective when all students participate simultaneously and the teacher has a way of checking everyone’s answers at the same time. Individual response boards or student dry-erase boards are tools which can be used to achieve this goal.
Struggling Students and Differentiated Instruction

It is imperative that teachers identify the best way to maximize the participation of all students in mental math activities. Undoubtedly there will be some students who experience considerable difficulty with the strategies assigned to their grade and who require special consideration. You may decide to provide these students with alternative questions to the ones you are expecting the others to do, perhaps involving smaller or more manageable numbers. Alternatively, you may just have the student complete fewer questions or provide more time.

There may be students in the upper grades who do not have command of the basic facts. For the teacher, that may mean going back to strategies at a lower grade level to build success, and accelerating them vertically to help students catch up. For example, if the students are in grade 6 and they don’t yet know the addition facts, you can find the strategies for teaching them in the grade 2 Mental Math Guide and the grade 2 Curriculum Guide. The students, however, are more intellectually mature, so you can immediately apply those same strategies to tens, hundreds, and thousands, and to estimation of whole numbers and decimal sums.

The more senses you can involve when introducing the facts, the greater the likelihood of success for all students, but especially for students experiencing difficulty.
Many of the thinking strategies supported by research and outlined in the curriculum advocate for a variety of learning modalities. For example:

- Visual (images for the addition doubles; hands on a clock for the “times-five” facts)

- Auditory (silly sayings and rhymes: “6 times 6 means dirty tricks; 6 x 6 is 36”)

- Patterns in Number (the product of an even number multiplied by 5 ends in 0 and the tens digit is one less than the number being multiplied)

- Tactile (ten frames, base ten blocks)

- Helping Facts (8 x 9 = 72, so 7 x 9 is one less group of 9; 72 - 9 = 63)

Whatever differentiation you make it should be to facilitate the student’s development in mental computation, and this differentiation should be documented and examined periodically to be sure it is still necessary.

**Combined Grade Classrooms**

What you do in these situations may vary from one strategy to another. Sometimes the students may be all doing the same strategy, sometimes with the same size or type of number, sometimes with different numbers. For example, in a combined grade 2-3 class, students might be working on the “make ten” strategy for addition. The teacher would ask the grade 2 students questions such as 9 + 6 or 5 + 8, while the grade 3 students would be given questions such as 25 + 8 or 39 + 6; the same strategy is applied, but at different levels of difficulty.

Other times, you may decide to introduce different strategies at different times on the first day, but conduct the reinforcements at the same time on subsequent days using the appropriate exercises for each grade level.

It is important to remember that there will be students in the lower grade who can master some, or all, the strategies expected for the higher grade, and some students in the higher grade who will benefit from the reinforcement of the strategies from the lower grade.
Assessment

Your assessment of mental computation should take a variety of forms. In addition to the traditional quizzes that involve students recording answers to questions that you give one-at-a-time in a certain time frame, you should also record any observations you make during the practice sessions. You should also ask students for oral responses and explanations, and have them explain strategies in writing. Individual interviews can provide you with many insights into a student’s thinking, especially in situations where paper-and-pencil responses are weak.

Individual interviews can provide you with many insights into a student’s thinking, especially in situations where paper-and-pencil responses are weak.

Timed Tests of Basic Facts

Some of the former approaches to fact learning were based on stimulus-response; that is, the belief that students would automatically give the correct answer if they heard the fact over-and-over again. No doubt, many of us learned our facts this way. These approaches often used a whole series of timed tests of 50 to 100 items to reach the goal.

... the thinking strategy approach prescribed by our curriculum is to teach students strategies that can be applied to a group of facts with mastery being defined as a correct response in 3 seconds or less.

In contrast, the thinking strategy approach prescribed by our curriculum is to teach students strategies that can be applied to a group of facts with mastery being defined as a correct response in 3 seconds or less. The traditional timed test would have limited use in assessing this goal. To be
sure, if you gave your class 50 number facts to be answered in 3 minutes and some students completed all, or most, of them correctly, you would expect that these students know their facts. However, if other students only completed some of these facts and got many of those correct, you wouldn’t know how long they spent on each question and you wouldn’t have the information you need to assess the outcome. You could use these sheets in alternative ways, however.

For example:

• Ask students to quickly circle the facts which they think are “hard” for them and just complete the others. This type of self assessment can provide teachers with valuable information about each student’s level of confidence and perceived mastery.

• Ask students to circle and complete only the facts for which a specific strategy would be useful. For example, circle and complete all the “double-plus-1" facts.

• Ask them to circle all the “make ten” facts and draw a box around all “two-apart" facts. This type of activity provides students with the important practice in strategy selection and allows the teacher to assess whether or not students recognize situations for which a particular strategy works.

Parents and Guardians: Partners in Developing Mental Math Skills

Parents and guardians are valuable partners in reinforcing the strategies you are developing in school. You should help parents understand the importance of these strategies in the overall development of their children’s mathematical thinking, and encourage them to have their children do mental computation in natural situations at home and out in the community. Through various forms of communication, you should keep parents abreast of the strategies you are teaching and the types of mental computations they should expect their children to be able to do.
Fact Learning
A. Fact Learning - Addition and Subtraction

• Reviewing Addition and Subtraction Facts and Fact Learning Strategies

At the beginning of grade 5, it is important to ensure that students review the addition and subtraction facts with sums/minuends to 18 and the fact learning strategies addressed in previous grades. All subtraction facts can be completed using a “think addition” strategy, especially by students who know their addition facts very well.

Students can use these facts and strategies when doing mental math addition with numbers in the 10s, 100s, 1000s and 10 000s in grade 5. Further information about these strategies can be found in the grade 3 mental math teacher’s guide.

Examples

The following are the addition fact strategies with examples, and examples of the same facts applied to 10s, 100, and 1000s:

a) Doubles Facts: 4 + 4, 40 + 40, 400 + 400, and 4000 + 4000
b) Plus One Facts: (next number) 5 + 1, 50 + 10, 500 + 100, 5000 + 1000
c) Plus Two Facts: (2-more-than facts) 7 + 2, 70 + 20, 700 + 200, 7000 + 2000
d) Plus Three Facts: 6 + 3, 60 + 30, 600 + 300, 6000 + 3000
e) Near Doubles: (1-apart facts) 3 + 4, 30 + 40, 300 + 400, 3000 + 4000
f) Plus Zero Facts: (no-change) 8 + 0, 80 + 0, 800 + 0, 8000 + 0
g) **Doubles Plus 2 Facts**: (double in-between or 2-apart facts) 5 + 3, 50 + 30, 500 + 300, 5000 + 3000

h) **Make 10 Facts**: 9 + 6, 90 + 60, 900 + 600; 8 + 4, 80 + 40, 800 + 400

l) **Make 10 Extended**: (with a 7) 7 + 4, 70 + 40, 700 + 400, 7000 + 4000

A thinking strategy is a way of thinking that helps complete a fact quickly. For a strategy to be a thinking strategy, it must be done mentally and it must be efficient. Students who have mastered the number facts no longer rely on thinking strategies to recall them.
B. Fact Learning – Multiplication and Division

Most students will have mastered the multiplication facts with products to 81 by the end of grade 4. These facts, and the thinking strategies used to acquire them, should be reviewed and reinforced throughout the year. The related division facts will be mastered in grade 5.

• Multiplication Fact Learning Strategies
Review of the multiplication facts and the related fact learning strategies should be done at the beginning of grade 5. Most students will have mastered the multiplication facts with products to 81 by the end of grade 4. This year, students will then apply these strategies to the related division facts and work toward mastery.

Following are the strategies to be introduced by the teacher, in sequence, starting at grade 3 and continuing through grade 6 for those students who need them. An understanding of the commutative or “turnaround” property in multiplication greatly reduces the number of facts to be mastered.

• x2 Facts (with turnarounds): 2x2, 2x3, 2x4, 2x5, 2x6, 2x7, 2x8, 2x9
These are directly related to the addition doubles and teachers need to make this connection clear. For example, 3 + 3 is double 3 (6); 3 x 2 and 2 x 3 are also double 3.

• Nifty Nines (with turnarounds): 6x9, 7x9, 8x9, 9x9
There are two patterns in the nine-times table that students should discover:

1. When you multiply a number by 9, the digit in the tens place in the product is one less than the number being multiplied. For example in 6 x 9, the digit in the tens place of the product will be 5.

2. The two digits in the product must add up to 9. So in this example, the number that goes with 5 to make nine is 4. The answer, then, is 54.
Some students might also figure out their 9-times facts by multiplying first by 10, and then subtracting. For example, for $7 \times 9$ or $9 \times 7$, you could think “7 tens is 70, so 7 nines is 70 - 7, or 63.

- **Fives Facts** (with turnarounds): $5 \times 3$, $5 \times 4$, $5 \times 5$, $5 \times 6$, $5 \times 7$

  It is easy to make the connection to the multiplication facts involving 5s using an analog clock. For example, if the minute hand is on the 6 and students know that means 30 minutes after the hour, then the connection to $6 \times 5 = 30$ can be made. This is why you may see the Five Facts referred to as the “clock facts.” This would be the best strategy for students who know how to tell time on an analog clock, a specific outcome from the grade 3 curriculum.

  You should also introduce the two patterns that result when numbers are multiplied by 5:

  1. For even numbers multiplied by 5, the answer always ends in zero, and the digit in the tens place is half the other number. So, for $8 \times 5 = 40$.

  2. For odd numbers multiplied by 5, the product always ends in 5, and the digit in the tens place is half of the number that comes before the other number. So, for $5 \times 9 = 45$.

  The more senses you can involve when introducing the facts, the greater the likelihood of success for all students, but especially for students experiencing difficulty.

- **Ones Facts** (with turnarounds): $1 \times 1$, $1 \times 2$, $1 \times 3$, $1 \times 4$, $1 \times 5$, $1 \times 6$, $1 \times 7$, $1 \times 8$, $1 \times 9$

  While the ones facts are the “no change” facts, it is important that students understand why there is no change. Many students get these facts confused with the addition facts involving 1. For example $6 \times 1$ means six groups of 1 or $1 + 1 + 1 + 1 + 1 + 1$ and $1 \times 6$ means one group of 6. It is important to avoid teaching arbitrary rules such as “any number multiplied by one is that number”. Students will come to this rule on their own given opportunities to develop understanding.
• **The Tricky Zeros Facts**
  As with the ones facts, students need to understand why these facts all result in zero because they are easily confused with the addition facts involving zero. Teachers must help students understand the meaning of the number sentence. For example: 6 × 0 means “six 0s or “six sets of nothing.” This could be shown by drawing six boxes with nothing in each box. 0 × 6 means “zero sets of 6.” Ask students to use counters or blocks to build two sets of 6, then 1 set of 6 and finally zero sets of 6 where they don’t use any counters or blocks. They will quickly realize why zero is the product. Similar to the previous strategy for teaching the ones facts, it is important not to teach a rule such as “any number multiplied by zero is zero”. Students will come to this rule on their own, given opportunities to develop understanding.

• **Threes Facts** (with turnarounds): 3x3, 3x4, 3x6, 3x7, 3x8, 3x9
  The strategy here, is for students to think “times 2, plus another group”. So for 7 x 3 or 3 x 7, the student should think “7 times 2 is 14, plus 7 more is 21”.

• **Fours Facts** (with turnarounds): 4x4, 4x6, 4x7, 4x8, 4x9
  One strategy that works for any number multiplied by 4 is “double-double”. For example, for 6 x 4, you would double the 6 (12) and then double again (24). Another strategy that works any time one (or both) of the factors is even, is to divide the even number in half, then multiply, and then double your answer. So, for 7 x 4, you could multiply 7 x 2 (14) and then double that to get 28. For 16 x 9, think 8 x 9 (72) and 72 + 72 = 70 + 70 (140) plus 4 = 144.

• **The Last Six Facts**
  After students have worked on the above seven strategies for learning the multiplication facts, there are only six facts left to be learned and their turnarounds: 6 × 6; 6 × 7; 6 × 8; 7 × 7; 7 × 8 and 8 × 8. At this point, the students themselves can probably suggest strategies that will help with quick recall of these facts. You should put each fact before them and ask for their suggestions.

</table>

After students have mastered each cluster of multiplication facts, it is appropriate to have them learn the corresponding division facts. One strategy for learning the division facts is “think multiplication”.

Mental Computation
C. Mental Computation – Addition

Your goal for teaching mental computation should be to show students a wide variety of mental methods, provide opportunities where each method can be employed, and encourage students to use mental methods regularly to improve their skills.

- Front-End Addition (Extension)
  This strategy involves adding the highest place values and then adding the sums of the next place value(s). In Grade 4, the Front-End Addition strategy was extended to numbers in the thousands. In grade 5, it includes decimal 10ths and 100ths.

Examples
  For $37 + 26$, think: “30 and 20 is 50 and 7 and 6 is 13; 50 plus 13 is 63.”
  For $450 + 380$, think, “400 and 300 is 700, 50 and 80 is 130; 700 plus 130 is 830.”
  For $3300 + 2800$, think, “3000 and 2000 is 5000, 300 and 800 is 1100; 500 plus 1100 is 6100.”
  For $2070 + 1080$, think, “2000 and 1000 is 3000, 70 and 80 is 150, and 3000 and 150 is 3150.”

Practice Items

a) Numbers in the 10s, 100s and 1000s

<table>
<thead>
<tr>
<th>Sum 1</th>
<th>Sum 2</th>
<th>Sum 3</th>
</tr>
</thead>
<tbody>
<tr>
<td>45 + 38 =</td>
<td>34 + 18 =</td>
<td>53 + 29 =</td>
</tr>
<tr>
<td>15 + 66 =</td>
<td>74 + 19 =</td>
<td>190 + 430 =</td>
</tr>
<tr>
<td>340 + 220 =</td>
<td>470 + 360 =</td>
<td>607 + 304 =</td>
</tr>
<tr>
<td>3500 + 2300 =</td>
<td>5400 + 3400 =</td>
<td>6800 + 2100 =</td>
</tr>
<tr>
<td>2900 + 6000 =</td>
<td>3700 + 3200 =</td>
<td>7500 + 2400 =</td>
</tr>
<tr>
<td>8800 + 1100 =</td>
<td>2700 + 7200 =</td>
<td>6300 + 4400 =</td>
</tr>
</tbody>
</table>
b) Numbers in the 10ths and 100ths

\[
\begin{align*}
4.6 + 3.2 &= \quad 5.4 + 3.7 &= \quad 1.85 + 2.25 &= \\
3.3 + 2.4 &= \quad 6.6 + 2.5 &= \quad 0.36 + 0.43 &= \\
1.5 + 1.5 &= \quad 0.75 + 0.05 &= \quad 0.45 + 0.44 &= \\
\end{align*}
\]

*Add your own practice items*
• **Break Up and Bridge (Extension)**
  This strategy is similar to front-end addition except that you begin with all of the first number and then add on parts of the second number beginning with the largest place value. In Grade 4, the Break Up and Bridge strategy was extended to include numbers in the hundreds. In grade 5, it includes numbers in the 1000s as well as decimal 10ths and 100ths.

**Examples**
For 45 + 36, think, “45 and 30 (from the 36) is 75, and 75 plus 6 (the rest of the 36) is 81.”

For 537 + 208, think, “537 and 200 is 737, and 737 plus 8 is 745.”

For 5300 plus 2400, think, “5300 and 2000 (from the 2400) is 7300 and 7300 plus 400 (from the rest of 2400) is 7700.”

For 3.6 plus 5.3, think, “3.6 and 5 (from the 5.3) is 8.6 and 8.6 plus 0.3 (the rest of 5.3) is 8.9.”

**Practice Items**
a) Numbers in the 10s and 100s
   
   37 + 42 = 72 + 21 = 88 + 16 = 
   74 + 42 = 325 + 220 = 301 + 435 = 
   747 + 150 = 142 + 202 = 370 + 327 = 

b) Numbers in the 1000s
   
   7700 + 1200 = 4100 + 3600 = 5700 + 2200 = 
   7300 + 1400 = 2800 + 6100 = 3300 + 3400 = 
   5090 + 2600 = 17 400 + 1300 = 

c) Numbers in the 10ths and 100ths
   
   4.2 + 3.5 = 6.3 + 1.6 = 4.2 + 3.7 = 
   6.1 + 2.8 = 0.32 + 0.56 = 2.08 + 3.2 = 
   4.15 + 3.22 = 5.43 + 2.26 = 6.03 + 2.45 = 
   15.45 + 1.25 = 43.30 + 7.49 = 70.32 + 9.12 = 

*Add your own practice items*
• Finding Compatibles (Extension)

Compatible numbers are sometimes referred to as friendly numbers or nice numbers in other professional resources. This strategy for addition involves looking for pairs of numbers that combine to make a sum that will be easy to work with. Some examples of common compatible numbers include 1 and 9; 40 and 60; 75 and 25 and 300 and 700.

Compatible numbers are sometimes referred to as friendly numbers or nice numbers ... Some examples of common compatible numbers include 1 and 9; 40 and 60; 75 and 25 and 300 and 700.

In grade 4, this strategy was extended to 100s. In grade 5, it includes numbers in the 10ths and 100ths.

Examples
For $3 + 8 + 7 + 6 + 2$, think, “3 and 7 is 10, 8 and 2 is 10, so 10 and 10 and 6 is 26.”

For $25 + 47 + 75$, think, “25 and 75 is 100, so 100 and 47 is 147.”

For $400 + 720 + 600$, think, “400 and 600 is 1000, so the sum is 1720.”

For $3000 + 7000 + 2400$, think, “3000 and 7000 is 10000, so 10000 and 2400 is 12400.”

Practice Items
a) Numbers in the 10s, 100s & 1000s

$11 + 59 = 33 + 27 = 60 + 30 + 40 = 75 + 95 + 25 = 80 + 20 + 79 = 40 + 72 + 60 = 90 + 86 + 10 = 125 + 25 = 475 + 25 = 625 + 75 = 290 + 510 = 300 + 437 + 700 = 800 + 740 + 200 = 900 + 100 + 485 = 4400 + 1600 + 3000 = 9000 + 3300 + 1000 = 3250 + 3000 + 1750 = 2200 + 2800 + 600 = 3000 + 300 + 700 + 2000 = 3400 + 5600 =
b) Numbers in the 10ths and 100ths are.

\[ 0.6 + 0.9 + 0.4 + 0.1 = \]
\[ 0.7 + 0.1 + 0.9 + 0.3 = \]
\[ 0.4 + 0.5 + 0.6 + 0.2 + 0.5 = \]
\[ 0.80 + 0.26 = \]
\[ 0.2 + 0.4 + 0.8 + 0.6 = \]
\[ 0.2 + 0.4 + 0.3 + 0.8 + 0.6 = \]
\[ 0.25 + 0.50 + 0.75 = \]
\[ 0.45 + 0.63 = \]

*Add your own practice items*
In the initial activities involving a strategy, you should expect to have students do the computation the way you modeled it. Later, however, you may find that some students employ their own variation of the strategy. If it is logical and efficient for them, so much the better.

• Compensation (Extension)

This strategy involves changing one number in a sum to a nearby ten, hundred, thousand, or decimal tenth or hundredth, carrying out the addition using that changed number, and then adjusting the answer to compensate for the original change. Students should understand that the reason a number is changed is to make it more compatible and easier to work with. They must also remember to adjust their answer to account for the change that was made.

Examples
For 52 + 39, think, “52 plus 40 is 92, but I added 1 too many to take me to the next 10, so I subtract one from my answer to get 91.”
For 345 + 198, think, “345 + 200 is 545, but I added 2 too many; so I subtract 2 from 545 to get 543.”
For 4500 plus 1900, think, “4500 + 2000 is 6500 but I added 100 too many; so, I subtract 100 from 6500 to get 6400.”
For 0.54 plus 0.29, think, “0.54 + 0.3 is 0.84 but I added 0.01 too many; so, I subtract 0.01 from 0.84 to compensate, to get 0.83.”
**Practice Items**

a) Numbers in the 10s and 100s

\[
\begin{align*}
56 + 8 &= 72 + 9 &= 44 + 27 = \\
14 + 58 &= 21 + 48 &= 255 + 49 = \\
371 + 18 &= 125 + 49 &= 504 + 199 = \\
354 + 597 &= 826 + 99 &= 676 + 197 = \\
304 + 399 &= 526 + 799 = 
\end{align*}
\]

b) Numbers in the 1000s

\[
\begin{align*}
1300 + 800 &= 5400 + 2900 &= 6421 + 1900 = \\
3450 + 4800 &= 2330 + 5900 &= 15200 + 2900 = \\
4621 + 3800 &= 2111 + 4900 &= 2050 + 6800 = 
\end{align*}
\]

c) Numbers in the 10ths and 100ths

\[
\begin{align*}
0.71 + 0.09 &= 0.56 + 0.08 &= 0.32 + 0.19 = \\
0.44 + 0.29 &= 0.17 + 0.59 &= 2.31 + 0.99 = \\
4.52 + 0.98 &= 1.17 + 0.39 &= 25.34 + 0.58 = 
\end{align*}
\]

*Add your own practice items*
• Make 10s, 100s, or 1000s (Extension)

*Make Ten* is a thinking strategy introduced in grade 2 for addition facts which have an 8 or a 9 as one of the addends. It involves taking part of the other number and adding it to the 8 or 9 to make a 10 and then adding on the rest.

For example:

For 8 + 6, you take 2 from the 6 and give it to the 8 to make 10 + 4. In Grade 4, this strategy was extended to “make 100s” and “make 1000s.” At the grade 5 level, additional practice with this strategy will be beneficial.

**Examples**

For 58 + 6, think, “58 plus 2 (from the 6) is 60, and 60 plus 4 (the other part of 6) is 64.”

For 350 + 59, think, “350 plus 50 is 400, and 400 plus 9 is 409.”

For 7400 + 790, think, “7400 plus 600 is 8000, and 8000 plus 190 is 8190.”

**Practice Items**

58 + 6 = 5 + 49 = 29 + 3 =
38 + 5 = 680 + 78 = 490 + 18 =
170 + 40 = 570 + 41 = 450 + 62 =
630 + 73 = 560 + 89 = 870 + 57 =
780 + 67 = 2800 + 460 = 5900 + 660 =
1700 + 870 = 8900 + 230 = 3500 + 590 =
2200 + 910 = 3600 + 522 = 4700 + 470 =

D. Mental Computation – Subtraction

• Back Down Through 10/100/1000

This strategy extends one of the strategies students learned in Grade 3 for fact learning. It involves subtracting a part of the subtrahend to get to the nearest ten or hundred, or thousand and then subtracting the rest of the subtrahend. It was introduced in grade 3 for subtraction of 2-digit numbers and extended to numbers in the 100s in grade 4. In grade 5, this strategy includes numbers in the 1000s.

Examples
For 15 - 8, think, “15 subtract 5 (one part of the 8) is 10, and 10 subtract 3 (the other part of the 8) is 7.”
For 74 - 6, think, “74 subtract 4 (one part of the 6) is 70 and 70 subtract 2 (the other part of the 6) is 68.”
For 530 - 70, think, “530 subtract 30 (one part of the 70) is 500 and 500 subtract 40 (the other part of the 70) is 460.”
For 8600 - 700, think, “8600 subtract 600(one part of the 700) is 8000 and 8000 subtract 100 (the rest of the 700) is 7900.”

Practice Items
a) Numbers in the 10s and 100s
   74 - 7 = 97 - 8 = 53 - 5 =
   420 - 60 = 340 -70 = 630 - 60 =
   540 - 70 = 760 - 70 = 320 - 50 =
b) Numbers in the 1000s
   9200 - 500 = 4700 - 800 = 6100 - 300 =
   7500 - 700 = 800 - 600 = 4200 - 800 =
   9500 - 600 = 3400 - 700 = 2300 - 600 =

Add your own practice items
Situations must be regularly provided to ensure that students have sufficient practice with mental math strategies and that they use their skills as required. It is recommended that regular, maybe daily, practice be provided.

- **Up Through 10/100/1000 (Extension)**
  This strategy is an extension of the “Up through 10” strategy that students learned in Grade 3 to help master the subtraction facts. It can also be thought of as, “counting on to subtract” (See Fact Learning - Subtraction in this booklet).

  To apply this strategy, you start with the smaller number (the subtrahend) and keep track of the distance to the next 10, 100, 1000 and then add this amount to the rest of the distance to the greater number (the minuend). In grade 5, the strategy is extended to numbers involving tenths and hundredths.

  **Examples**
  For 613 - 594, think, “It’s 6 from 594 to 600 and then 13 more to get to 613; that’s 19 altogether.”

  For 84 - 77, think, “It’s 3 from 77 to 80 and 4 more to 84; so that’s 7 altogether.”

  For 2310 - 1800, think, “It’s 200 from 1800 to 2000 then 310 more, so that’s 510 in all.”

  For 12.4 - 11.8, think: “It’s 2 tenths to get to 12 from 11.8 and then 4 more tenths, so that’s 6 tenths, or 0.6 altogether.”

  For 6.12 - 5.99, think, “It’s one hundredth from 5.99 to 6.00 and then twelve more hundredths to get to 6.12; So the difference is 1 hundredth plus 12 hundredths, or 0.13.”
Practice Items

a) Numbers in the 10s and 100s

11 - 7 = 17 - 8 = 13 - 6 =
12 - 8 = 15 - 6 = 16 - 7 =
95 - 86 = 67 - 59 = 46 - 38 =
88 - 79 = 62 - 55 = 42 - 36 =
715 - 698 = 612 - 596 = 817 - 798 =
411 - 398 = 916 - 897 = 513 - 498 =
727 - 698 = 846 - 799 = 631 - 597 =

b) Numbers in the 1000s

5170 - 4800 = 3210 - 2900 = 8220 - 7800 =
9130 - 8950 = 2400 - 1800 = 4195 - 3900 =
7050 - 6750 = 1280 - 900 = 8330 - 7700 =

c) Numbers in the 10ths and 100ths

15.3 - 14.9 = 27.2 - 26.8 = 19.1 - 18.8 =
45.6 - 44.9 = 23.5 - 22.8 = 50.1 - 49.8 =
34.4 - 33.9 = 52.8 - 51.8 = 70.3 - 69.7 =
3.25 - 2.99 = 5.12 - 4.99 = 4.05 - 3.98 =
3.24 - 2.99 = 8.04 - 7.98 = 6.53 - 5.97 =
24.12 - 23.99 = 36.11 - 35.98 = 100.72 - 99.98 =

Add your own practice items
• **Compensation (Extension)**  
This strategy for subtraction was first introduced in grade 4. It involves changing the subtrahend (the amount being subtracted) to the nearest 10 or 100, carrying out the subtraction, and then adjusting the answer to compensate for the original change. In grade 5, the strategy is extended to numbers in the 1000s.

**Examples**
For 17 – 9, think, “I can change 9 to 10 and then subtract 17 – 10; that gives me 7, but I only need to subtract 9, so I’ll add 1 back on. My answer is 8.”

For 56 - 18, think, “I can change 18 to 20 and then subtract 56 - 20; that gives me 36, but I only need to subtract 18, so I’ll add 2 back on. My answer is 38.”

For 756 - 198, think: “756 - 200 = 556, and 556 + 2 = 558”

For 5760 - 997, think: 5760 - 1000 is 4760; but I subtracted 3 too many; so, I add 3 to 4760 to compensate to get 4763.

For 3660 - 996, think: 3660 - 1000 + 4 = 2664.

**Practice Items**

a) Numbers in the 10s
   - 15 - 8 =
   - 74 - 9 =
   - 65 - 9 =
   - 17 - 9 =
   - 84 - 7 =
   - 87 - 9 =
   - 23 - 8 =
   - 92 - 8 =
   - 73 - 7 =

b) Numbers in the 100s
   - 673 - 99 =
   - 775 - 198 =
   - 641 - 197 =
   - 765 - 99 =
   - 854 - 399 =
   - 534 - 398 =
   - 802 - 397 =
   - 953 - 499 =
   - 647 - 198 =
   - 444 - 97 =
   - 721 - 497 =
   - 513 - 298 =
C) Numbers in the 1000s

8620 - 998 = 4100 - 994 = 5700 - 397 =
9850 - 498 = 3720 - 996 = 2900 - 595 =
4222 - 998 = 7310 - 194 = 75316 - 9900

Add your own practice items
• **Balancing For a Constant Difference (New)**

This strategy for subtraction involves adding or subtracting the same amount from both the subtrahend and the minuend to get a ten, hundred or thousand in order to make the subtraction easier. This strategy needs to be carefully introduced to convince students that it works because the two numbers are the same distance apart as the original numbers.

Examining pairs of numbers on a number line such as a metre stick can help students understand the logic of the strategy. For example, the difference or distance between the numbers 66 and 34 (66 - 34) on a number line is the same as the difference between 70 and 38, and it’s easier to mentally subtract the second pair of numbers.

Because both numbers change, many students may need to record at least the first changed number to keep track.

*Adding or subtracting the same amount from both numbers maintains the distance between them and makes the mental subtraction easier. Examining pairs of numbers on a number line such as a metre stick can help students understand the logic of this strategy.*

**Examples**

1) For 87 - 19, think, “Add 1 to both numbers to get 88 - 20, so 68 is the answer.”

   For 76 - 32, think, “Subtract 2 from both numbers to get 74 - 30, so the answer is 44.”

2) For 345 - 198, think, “Add 2 to both numbers to get 347 - 200; the answer is 147.”

   For 567 - 203, think, “Subtract 3 from both numbers to get 564 - 200; so the answer is 364.”

3) For 8.5 - 1.8, think, “Add 2 tenths to both numbers to get 8.5 - 2.0; That’s 6.7.”

   For 5.4 - 2.1, think, “Subtract 1 tenth from both numbers to get 5.3 - 2.0 or 3.3.”
4) For 6.45 - 1.98, think, “Add 2 hundredths to both numbers to get 6.47 - 2.00, so 4.47 is the answer.”

For 5.67 - 2.03, think, “Subtract 3 hundredths from both numbers to get 5.64 - 2.00. The answer is 3.64.”

**Practice Items**

a) Numbers in the 10s and 100s

- $85 - 18 = 42 - 17 = 36 - 19 =$
- $78 - 19 = 67 - 18 = 75 - 38 =$
- $88 - 48 = 94 - 17 = 45 - 28 =$
- $67 - 32 = 88 - 43 = 177 - 52 =$
- $649 - 299 = 563 - 397 = 823 - 298 =$
- $912 - 797 = 737 - 398 = 456 - 198 =$
- $631 - 499 = 811 - 597 = 628 - 298 =$
- $736 - 402 = 564 - 303 = 577 - 102 =$
- $948 - 301 = 437 - 103 = 819 - 504 =$

b) Numbers in the 10ths and 100ths

- $6.4 - 3.9 = 7.6 - 4.2 = 8.7 - 5.8 =$
- $4.3 - 1.2 = 9.1 - 6.7 = 5.0 - 3.8 =$
- $6.3 - 2.2 = 4.7 - 1.9 = 12.5 - 4.3 =$
- $15.3 - 5.7 = 8.36 - 2.99 = 7.45 - 1.98 =$
- $5.40 - 3.97 = 6.25 - 2.01 = 8.53 - 6.02 =$

*Add your own practice items*
• **Break Up and Bridge**

With this subtraction strategy, first introduced in grade 4, you start with the larger number (the minuend) and subtract the highest place value of the second number first (the subtrahend), and then the rest of the subtrahend. The strategy is extended to numbers in the 1000s in grade 5.

**Examples**

For 92 - 26, think, “92 subtract 20 (from the 26) is 72 and 72 subtract 6 is 66.”

For 745 - 203, think, “745 subtract 200 (from the 203) is 545 and 545 minus 3 is 542.”

For 8369 - 204, think, “8369 subtract 200 is 8169 and minus 4 (the rest of the 204) is 8165.”

**Practice Items**

a) Numbers in the 10s and 100s

| 79 - 37 = | 93 - 72 = | 98 - 22 = |
| 79 - 41 = | 74 - 15 = | 77 - 15 = |
| 95 - 27 = | 85 - 46 = | 67 - 42 = |
| 56 - 31 = | 86 - 54 = | 156 - 47 = |
| 736 - 301 = | 848 - 207 = | 927 - 605 = |
| 632 - 208 = | 741 - 306 = | 758 - 205 = |
| 928 - 210 = | 847 - 412 = | 746 - 304 = |

b) Numbers in the 1000s

| 9275 - 8100 = | 6350 - 4200 = | 8461 - 4050 = |
| 10 270 - 8100 = | 15 100 - 3003 = | 4129 - 2005 = |

E. Mental Computation – Multiplication and Division

• Using Multiplication Facts for Tens, Hundreds and Thousands
This strategy applies to tens, hundreds and thousands (with one non-zero digit in the number) multiplied by a 1-digit number. It could also be used for 2-digit by 2-digit multiplication when both numbers end in zero. Students multiply the non-zero digits as if they were multiplication facts, and then attach the appropriate place value name to the result.

Examples
For 3 \times 70, think, “3 times 7 tens is 21 tens, or 210.”
For 6 \times 900, think: “6 times 9 hundreds is 54 hundreds, or 5400.”
For 30 \times 80, think, “Tens by tens is hundreds, so 3 tens by 8 tens is 24 hundreds, or 2 400.”
For 60 \times 20, think, “Tens by tens is hundreds.6 tens by 2 tens is 12 hundreds, or 1200.”

Practice Items

| 4 \times 30 = | 8 \times 40 = | 9 \times 30 = |
| 6 \times 50 = | 70 \times 7 = | 90 \times 40 = |
| 60 \times 20 = | 30 \times 50 = | 90 \times 60 = |
| 40 \times 40 = | 70 \times 90 = | 10 \times 400 = |
| 30 \times 600 = | 80 \times 200 = | 100 \times 50 = |
| 700 \times 30 = | 900 \times 50 = | 6 \times 200 = |
| 8 \times 600 = | 9 \times 800 = | 300 \times 4 = |
| 40 \times 80 = | 60 \times 20 = | 30 \times 50 = |
| 90 \times 60 = | 40 \times 40 = | 70 \times 90 = |
| 10 \times 400 = | 30 \times 600 = | 80 \times 200 = |
| 100 \times 50 = | 700 \times 30 = | 900 \times 50 = |

Add your own practice items
Multiplying by 10,100, and 1000 Using a Place-Value-Change Strategy (Extension)

This strategy is first introduced in grade 4 where students multiply by 10 and 100 mentally by applying their understanding of how the place values change. For example, when 8 is multiplied by 10 for a product of 80, the 8 ones becomes 8 tens, an increase of 1 place value. When 28 is multiplied by 100 for a product of 2800, the 2 tens increase two places to 2 thousands and the 8 ones increases two places to 8 hundred. All the place values of the number being multiplied increase one place when multiplying by 10, two places when multiplying by 100, and 3 places when multiplying by 1000.

Some students will see the pattern that one zero gets attached to a number that is multiplied by 10, two zeros get attached to a number multiplied by 100, and 3 zeros get attached to a number multiplied by 1000. However, understanding the “place-value-change strategy” will be more meaningful than the “attach zeros strategy” and will produce more correct answers, especially when decimal 10ths, 100ths and 1000ths are involved later in the year.

Later, when students are working with decimals, such as 100 × 0.12, using the “place-value-change strategy” will be more meaningful than the “attach-zeros strategy” and will more likely produce correct answers.”

Examples
For 24 x 10, the 2 tens increases one place to 2 hundreds and the 4 ones increases one place to 4 tens; 240
For 36 x 100, the 3 tens increases two places to 3 thousands and the 6 ones increases two places to 6 hundreds; 3600.
For 37 x 1000, the 3 tens will increase to 3 ten-thousands or 30 000, and the 7 tens will increase to 7 thousands. 30 000 plus 7000 is 37 000
**Practice Items**

10 × 53 = 10 × 34 = 87 × 10 =
10 × 20 = 47 × 10 = 78 × 10 =
92 × 10 = 10 × 66 = 40 × 10 =
100 × 7 = 100 × 2 = 100 × 15 =
100 × 74 = 100 × 39 = 37 × 100 =
10 × 10 = 55 × 100 = 100 × 83 =
100 × 70 = 40 × 100 = 100 × 22 =
1000 × 6 = 1000 × 14 = 83 × 1000 =
$73 × 1000 = $20 × 1000 = 16 × $1000 =
$3 × 10 = $7 × 10 = $50 × 10 =
10 × 3.3 = 4.5 × 10 = 0.7 × 10 =
8.3 × 10 = 7.2 × 10 = 10 × 4.9 =
100 × 2.2 = 100 × 8.3 = 100 × 9.9 =
7.54 × 10 = 8.36 x10 = 10 × 0.3 =
100 × 0.12 = 100 × 0.41 = 100 × 0.07 =
3.78 × 100 = 1000 × 2.2 = 1000 × 43.8 =
1000 × 5.66 = 8.02 × 1000 = 0.04 × 1000 =
3 m = _____mm 7m = ____mm 4.2m = ____mm

• Dividing by 10, 100, and 1000 Using a Place-Value-Change Strategy (New)

Again, it is important for students to explore the patterns that result when numbers are divided by 10, 100 or 1000. Calculators are useful tools for this exploratory work and should be used to help students understand that all the place values of the number being divided decrease one place when dividing by 10, two places when dividing by 100, and three places when dividing by 1000.

Examples

For, 60 ÷ 10, think, “The 6 tens will decrease to 6 ones; therefore, the answer is 6.”

For, 500 ÷ 10, think: “The 5 hundreds will decrease to 5 tens; therefore, the answer is 50.”

For, 7 500 ÷ 100, think, The 7 thousands will decrease to 7 tens and the 5 hundreds will decrease to 5 ones; therefore, the answer is 75.”

For, 75 000 ÷ 1000; think, “The 7 ten thousands will decrease to 7 tens and the 5 thousands will decrease to 5 ones; therefore, the answer is 75. “

Practice Items

70 ÷ 10 = 90 ÷ 10 = 40 ÷ 10 =
200 ÷ 10 = 800 ÷ 10 = 100 ÷ 10 =
400 ÷ 100 = 900 ÷ 100 = 6000 ÷ 100 =
4200 ÷ 100 = 7600 ÷ 100 = 8500 ÷ 100 =
9700 ÷ 100 = 4400 ÷ 100 = 10 000 ÷ 100 =
600 pennies = $____ 1800 pennies = $____ 5600 pennies = $____
82 000 ÷ 1000 = 98 000 ÷ 1000 = 12 000 ÷ 1000 =
66 000 ÷ 1000 = 70 000 ÷ 1000 = 100 000 ÷ 1000 =
430 000 ÷ 1000 = 104 000 ÷ 1000 = 4 500 ÷ 1000 =
77 000m = _____km 84 000m = _____km 7 700m = _____km

Add your own practice items
• **Multiplying by 0.1, 0.01, and 0.001 Using a Place-Value-Change Strategy (New)**

By now, students should have a good understanding of how place values change when multiplying and dividing by 10, 100 and 1000. Now they will apply this same strategy to decimal tenths, hundredths and thousandths. By exploring the patterns that result when numbers are multiplied by these fractional amounts they will see that all the place values of the number being multiplied decrease one place when multiplying by 0.1, two places when multiplying by 0.01 and three places when multiplying by 0.001.

All the place values of the number being multiplied decrease one place when multiplying by 0.1, two places when multiplying by 0.01 and three places when multiplying by 0.001.

**Examples**

For $5 \times 0.1$, think, “The 5 ones will decrease one place to 5 tenths, therefore the answer is 0.5.”

For, $0.4 \times 0.1$, think, “The 4 tenths will decrease one place to 4 hundredths, therefore the answer is 0.04.”

For $5 \times 0.01$, think, “The 5 ones will decrease two places to 5 hundredths, so the answer is 0.05.”

For, $0.4 \times 0.01$, think, “The 4 tenths will decrease two places to 4 thousandths, therefore the answer is 0.004.”

For $5 \times 0.001$, think, “The 5 ones will decrease three places to 5 thousandths; so, the answer is 0.005.”

### Adds your own practice items

- $4\text{mm} = _____\text{m}$
- $9\text{mm} = _____\text{m}$
- $6\text{m} = _____\text{km}$
• **Front End Multiplication - The Distributive Principle (New)**

This strategy is useful when multiplying 2-, 3-, and 4-digit numbers by 1-digit numbers. It involves calculating the product of the highest place value and the 1-digit number, and then adding this to the sub-product(s) of the other place values and the 1-digit number.

**Examples**

For $3 \times 62$, think, “6 tens times 3 is 18 tens (180) and 3 times 2 is 6 for a total of 186.”

For $706 \times 4$, think, “7 hundreds times 4 is 28 hundreds (2800) and 6 times 4 is 24 for a total of 2824.”

For $5 \times 6100$, think, “6 thousand times 5 is 30 thousands, and 5 times 100 is 500; so 30 000 plus 500 is 30 500.”

For $3.2 \times 6$, think, “3 times 6 is 18 and 6 times 2 tenths is 12 tenths or 1 and 2 tenths; so 18 plus 1.2 is 19.2.”

For $62 \times 0.2$, think: “60 times 2 tenths is 120 tenths or 12; and 2 tenths times 2 is 4 tenths or 0.4; so 12 plus 0.4 is 12.4.”

For $47 \times 0.3$, think, “40 times 3 tenths is 120 tenths or 12; and 7 times 3 tenths is 21 tenths or 2.1; so 12 plus 2.1 is 14.1”

**Practice Items**

$53 \times 3 = 32 \times 4 = 41 \times 6 =$

$29 \times 2 = 83 \times 3 = 75 \times 3 =$

$3 \times 503 = 209 \times 9 = 703 \times 8 =$

$606 \times 6 = 503 \times 2 = 804 \times 6 =$

$309 \times 7 = 122 \times 4 = 320 \times 3 =$

$6 \times 3100 = 5 \times 5100 = 2 \times 4300 =$

$3 \times 3200 = 2 \times 4300 = 7 \times 2100 =$

$4.6 \times 2 = 3.6 \times 0.2 = 8.3 \times 5 =$

$43 \times 0.5 = 96 \times 0.3 = 83 \times 0.9 =$

$7.9 \times 6 = 3.7 \times 4 = 52 \times 0.4 =$

$8.9 \times 5 = 75 \times 0.8 = 3.3 \times 7 =$

*Add your own practice items*
• **Compensation (New for Multiplication)**
  This strategy for multiplication involves changing one of the factors to a ten, hundred or thousand, carrying out the multiplication, and then adjusting the answer to compensate for the change that was made. This strategy could be used when one of the factors is near a ten, hundred or thousand.

**Examples**
For $6 \times 39$, think, “6 groups of 40 is 240. 6 groups of 39 would be 6 less; 240 - 6 = 234.”

For $7 \times 198$, think, “7 times 200 is 1400, but this is 14 more than it should be because there were 2 extra in each of the 7 groups; 1400 subtract 14 is 1368.”

For $19 \times 60$, think, “20 groups of 60 is 1200, so 19 groups of 60 would be 60 less; 1200 - 60 = 1140.”

Estimation
Estimation – Addition, Subtraction, Multiplication and Division

When asked to estimate, students often try to do the exact computation and then “round” their answer to produce an estimate that they think their teacher is looking for. Students need to see that estimation is a valuable and useful skill, one that is used on a daily basis by many people.

*Students need to see that estimation is a valuable and useful skill, one that is used on a daily basis by many people.*

Estimates can be very broad and general, or they can be quite close to the actual answer. It all depends on the reason for estimating in the first place, and these reasons can vary in context and according to the needs of the individual at the time.

Help students identify situations outside of school where they would estimate distances, number, temperature, length of time and discuss how accurate their estimates needed to be. Place these situations on an estimation continuum with broad, ball-park estimates at one end and estimates that are very close to the actual answer at the other.

For example:
In mathematics, it is essential that estimation strategies are used by students before attempting pencil/paper or calculator computations to help them determine whether or not their answers are reasonable.

When teaching estimation strategies, it is important to use words and phrases such as, about, almost, between, approximately, a little more than, a little less than, close to and near.

- **Rounding in Addition and Subtraction (Continued from Grade 4)**
  With this strategy for addition and subtraction, you start with the highest place values in each number, round them to the closest 10, 100 or 1000, and then add or subtract the rounded numbers.

  **Example**
  To estimate 378 + 230, think, “378 rounds to 400 and 230 rounds to 200; so, 400 plus 200 is 600.”

  To estimate 4276 + 3937, think, “4276 rounds to 4000 and 3937 rounds to 4000, so 4000 plus 4000 is 8000.”

  To estimate 594 - 203, think, “594 rounds to 600 and 203 rounds to 200, so 600 subtract 200 is 400.”

  To estimate 6237 - 2945, think, “6 237 rounds to 6000 and 2945 rounds to 3000, so 6000 subtract 3000 is 3000.”
**Practice Items**

\[
egin{align*}
28 + 57 &= 41 + 34 = 123 + 62 = \\
303 + 49 &= 137 + 641 = 223 + 583 = \\
6110 + 3950 &= 4460 + 7745 = 1370 + 6410 = \\
36 - 22 &= 43 - 8 = 54 - 18 = \\
834 - 587 &= 947 - 642 = 780 - 270 = \\
4807 - 1203 &= 7856 - 1250 = 5029 - 4020 = \\
\end{align*}
\]

Students should estimate automatically whenever faced with a calculation. Facility with basic facts and mental math strategies is key to estimation.

- **Rounding With “Fives”**

  a) *Addition*

  When the digit 5 is involved in the rounding procedure for numbers in the 10s, 100s, and 1000s, the number can be rounded up or down depending upon the effect the rounding will have in the overall calculation. For example, if both numbers to be added are about 5, 50, or 500, it is better to round one number up and one number down to minimize the effect the rounding will have in the estimation.

  **Examples**

  For 45 + 65, think, “Since both numbers involve 5s, it would be best to round to 40 + 70 to get 110.”

  For 4520 + 4610, think, “Since both numbers are both close to 500, it would be best to round to 4000 + 5000 to get 9000.”
**Practice Items**

a)  
35 + 55 = 45 + 31 = 26 + 35 =  
250 + 650 = 653 + 128 = 179 + 254 =  
384 + 910 = 137 + 641 = 798 + 387 =  
530 + 660 = 350 + 550 = 450 + 319 =  
2500 + 4500 = 4550 + 4220 = 6810 + 1550 =  
5184 + 2958 = 4867 + 6219 = 7760 + 3140 =

b) Subtraction

For subtraction, the process of estimation is similar to addition, except for situations where both numbers are close to 5, 50, or 500. In these situations, both numbers should be rounded up. If you round one number up and one down, it will increase the difference between the two numbers and your estimate will be farther from the actual answer.

**Examples**

To estimate 594 - 203, think, “594 rounds to 600 and 203 rounds to 200; so, 600 - 200 is 400.”

To estimate 6237 - 2945, think, “6237 rounds to 6000 and 2945 rounds to 3000; so, 6000 - 3000 is 3000.”

To estimate 5549 - 3487, think, “Both numbers are close to 500, so round both up; 6000 - 4000 is 2000.”

**Practice Items**

427 - 192 = 984 - 430 = 872 - 389 =  
594 - 313 = 266 - 94 = 843 - 715 =  
834 - 587 = 947 - 642 = 782 - 277 =  
4768 - 3068 = 6892 - 1812 = 7368 - 4817 =  
4807 - 1203 = 7856 - 1250 = 5029 - 4020 =  
8876 - 3640 = 9989 - 4140 = 1754 - 999 =

**Add your own practice items**
Ongoing practice in computational estimation is a key to developing understanding of numbers and number operations and increasing mental process skills.

**Rounding in Multiplication (New)**
To estimate the product of a 2-digit or 3-digit factor by a single-digit factor, the multi- digit factor is rounded to the nearest 10 or 100 and then multiplied by the single-digit factor.

**Examples**
To estimate $7 \times 64$, think, “64 rounds to 60, and 7 times 60 is 420.”
To estimate $8 \times 693$, think, “693 rounds to 700, and 8 times 700 is 560.”

**Practice Items**
\[
\begin{align*}
4 \times 59 &= \\
9 \times 43 &= \\
889 \times 3 &= \\
7 \times 821 &= \\
7 \times 22 &= \\
295 \times 6 &= \\
5 \times 503 &= \\
1 \times 795 &= \\
8 \times 61 &= \\
7 \times 402 &= \\
2 \times 888 &= \\
712 \times 4 &=
\end{align*}
\]

To estimate the product of two 2-digit numbers where the number in the ones place in both numbers is 5 or more, the smaller factor should be rounded up and the larger factor down.

**Example**
To estimate $76 \times 36$, round 36 (the smaller factor) up to 40, and round 76 (the larger factor down to 70) which equals $70 \times 40 = 2800$. This produces a closer estimate than rounding to $80 \times 40$ or $80 \times 30$. 
Practice Items

57 × 29 = 49 × 28 = 38 × 27 =
66 × 57 = 87 × 19 = 36 × 58 =
27 × 68 = 87 × 37 = 96 × 78 =

Add your own practice items

Computational estimation is a mental activity; therefore, regular oral practice, accompanied by the sharing of strategies must be provided.
• **Adjusted Front End Estimation for Addition and Subtraction (Extended to Decimal 10ths and 100ths)**

This strategy begins with a front-end estimate and then making an adjustment by considering some or all the values in the other place values. This will result in a more accurate estimate.

**Examples**

To estimate 437 + 545, think, “400 plus 500 is 900, but this can be adjusted by thinking 30 and 40 is 70, so the adjusted estimate would be 90 + 70 = 970.”

To estimate 3237 + 2125, think, “3000 plus 2000 is 5000, and 200 plus 100 is 300, so the adjusted estimate is 5300.”

To estimate 382 - 116, think, “300 subtract 100 is 200, and 80 - 10 is 70, so the adjusted estimate is 270.”

To estimate 6237 - 2954, think, “6000 subtract 2000 is 4000, and 954 would account for about another 1000; therefore, the adjusted estimate is 6000 - 2000 - 1000 or 3000.”

To estimate 8.64 + 5.28, think, “8 plus 5 is 13, and 0.64 plus 0.28 would account for another 1 whole; therefore, the adjusted estimate is 8 + 5 + 1 = 14.”

To estimate 7.12 - 3.89, think, “7 - 3, but 0.89 would account for about another 1 whole; therefore the adjusted estimate is 7 - 3 - 1 = 3.”
**Practice Items**

a) Estimating Sums

\[
\begin{align*}
251 + 445 &= 589 + 210 &= 320 + 275 = \\
642 + 264 &= 519 + 180 &= 148 + 450 = \\
5695 + 2450 &= 4190 + 1850 &= 4550 + 3445 = \\
5240 + 3790 &= 1910 + 5125 &= 7.45 + 1.56 = \\
5.89 + 2.10 &= 3.20 + 2.75 &= 6.43 + 2.67 = \\
3.19 + 2.81 &= 3.48 + 4.50 &= 2.45 + 4.60 = \\
$3.95 + $4.07 &= $2.73 - $2.22 = \\
\end{align*}
\]

b) Estimating Differences

\[
\begin{align*}
645 - 290 &= 720 - 593 &= 834 - 299 = \\
935 - 494 &= 6210 - 2987 &= 8040 - 5899 = \\
9145 - 4968 &= 7120 - 4975 &= 6148 - 3920 = \\
7.43 - 4.95 &= 5.29 - 2.99 &= 6.18 - 1.97 = \\
8.05 - 4.92 &= 8.11 - 4.98 &= 9.21 - 5.99 = \\
$6.45 - $5.98 &= $7.20 - $5.97 = $8.34 - $2.99 =
\end{align*}
\]

*Add your own practice items*

Estimation must be used with all computations, but when an exact answer is required, students need to decide whether it is more appropriate to use a mental strategy, pencil and paper, or some form of technology.
Appendix 1

Thinking Strategies in Mental Math

Mental math proficiency represents one important dimension of mathematical knowledge. Not all individuals will develop rapid mental number skills to the same degree. Some will find their strength in mathematics through other avenues, such as visual or graphic representations or creativity in solving problems. But mental math has a clear place in school mathematics. It is an area where many parents and families feel comfortable offering support and assistance to their children.

The following table identifies all of the thinking strategies in *Mental Math: Fact Learning, Mental Computation and Estimation* and the grade level in which they are first introduced. These strategies are then extended and developed in subsequent years.

For example, Front End Addition involving 2-digit numbers is first introduced in grade 2, continued in grade 3, extended to 3-digit numbers in grade 4, and to decimal tenths, hundredths, and thousandths in grades 5 and 6. The teachers guide for each grade level contains a complete description of each strategy with examples and practice items.

</table>

| Break Up and Bridge                    | With this front-end strategy, you start with all of the first number and add it to the highest place value in the other number, and then add on the rest. |

| Front-End Estimation for Addition and Subtraction | Add or subtract just the largest place values in each number to produce a “ball park” estimate. |

| Adjusted Front-End Estimation for Addition and Subtraction | Same as above, except the other place values are considered for a more accurate estimate. |

### Grade 4

| Make 10s, 100s, 1000s for addition | 48 + 36 is the same as 50 + 34 which is 84 |

<table>
<thead>
<tr>
<th>Multiplication Facts With Products to 81</th>
<th>Mastery by year-end</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Last Six Facts</td>
<td>For facts not already covered by previous thinking strategies</td>
</tr>
</tbody>
</table>

| Subtraction facts extended to numbers in the 10s, 100s 100s | Only 1 non-zero digit in each number eg. 600 - 400 = |

| Compensation (new for subtraction) | For 17-9, think, “17 - 10 is 7, but I subtracted 1 too many, so the answer is 8.” |

| Break Up and Bridge (new for subtraction) | For 92 - 26, think, “92 - 20 is 72 and then 6 more is 66.” |

<p>| Multiply by 10 and 100 using a place-value-change strategy | The place values for a number multiplied by 100 increase 2 places. Eg. 34 x 100; The 4 ones becomes 4 hundreds and the 3 tens becomes 3 thousand; 3000 + 400 = 3400 |</p>
<table>
<thead>
<tr>
<th><strong>Grade 5</strong></th>
<th></th>
</tr>
</thead>
</table>
| **Division Facts With Dividends to 81**  
- “Think-Multiplication” | Mastery by year-end  
For $36 ÷ 6$, think “6 times what equals 36?” |
| **Balancing for a Constant Difference** | Involves changing both numbers in a subtraction sentence by the same amount to make it easier to complete. The difference between the two numbers remains the same.  
Eg. for $27 - 16$, add 3 to each number and think, “$30 - 19 = 11$” |
| **Multiply by 0.1, 0.01, 0.001 using a place-value-change strategy** | The place values for a number multiplied by 0.1 decrease 1 place.  
Eg. $34 \times 0.1$; The 4 ones becomes 4 tenths and the 3 tens becomes 3 ones; 3 and 4 tenths, or 3.4. |
| **Front-End Multiplication (Distributive Principle)** | Involves finding the product of the single-digit factor and the digit in the highest place value of the second factor, and adding to this product a second sub-product. $706 \times 2 = (700 \times 2) + (6 \times 2) = 1412$ |
| **Compensation in Multiplication** | Involves changing one factor to a 10 or 100, carrying out the multiplication, and then adjusting the product to compensate for the change. $7 \times 198 = 7 \times 200 (1400) \text{ subtract } 14 = 1386$ |
| **Divide by 10, 100, 1000 using a place-value-change strategy.** | The place values for a number divided by 10 decrease 1 place.  
Eg. $34 ÷ 10$; The 4 ones becomes 4 tenths and the 3 tens becomes 3 ones; 3 and 4 tenths, or 3.4. |
| **Rounding in Multiplication** | Highest place values of factors are rounded and multiplied. When both numbers are close to 5 or 50, one number rounds up and the other down. |

<table>
<thead>
<tr>
<th><strong>Grade 6</strong></th>
<th></th>
</tr>
</thead>
</table>
| **Divide by 0.1, 0.01, 0.001 using a place-value-change strategy** | The place values for a number divided by 0.01 increase 2 places.  
Eg. $34 ÷ 0.01$; The 4 ones becomes 4 hundreds and the 3 tens becomes 3 thousand; $3000 + 400 = 3400$ |
| **Finding Compatible Factors (Associative Property)** | Involves looking for pairs of factors, whose product is easy to work with, usually multiples of 10. For example, for $2 \times 75 \times 500$, think, “$2 \times 500 = 1000$ and $1000 \times 75$ is 75 000.” |
| **Halving and Doubling** | One factor is halved and the other is doubled to make the multiplication easier. Students would need to record sub-steps.  
For example, $500 \times 88 = 1000 \times 44 = 44 000$. |
| **Using division facts for 10s, 100s 1000s** | Dividends in the 10s, 100s, and 1000s are divided by single digit divisors. The quotients would have only one digit that wasn’t a zero.  
For example, for $12 000 ÷ 4$, think single digit division facts. $12 ÷ 4 = 3$, and thousands divided by ones is thousands, so the answer is 3000. |
| **Partitioning the Dividend (Distributive Property)** | The dividend is broken up into two parts that are more easily divided by the divisor. For example, for $372 ÷ 6$, think, “$(360 + 12) ÷ 6$, so $60 + 2$ is 62.” |
